## SYLOW'S THEOREM

- Def: - let  $G$  be a group & let  $p$  be a prime.
- (1) A group of order  $p^\alpha$  for some  $\alpha \geq 1$  is called as  $p$ -group. A subgroup of  $G$  is called  $p$ -subgroup.
- (2) If  $G$  is a group of order  $p^k m$  where  $p \nmid m$  then a subgroup of order  $p^k$  is called a Sylow  $p$ -subgroup of  $G$ .
- (3)  $Syl_p(G) =$  Set of Sylow  $p$ -subgroups of  $G$   
 $n_p(G) =$  no. of Sylow  $p$ -subgroups of  $G$ .

Theorem  
(18)

### SYLOW'S THEOREMS:-

(i) Sylow Theorem 1: let  $G$  be a group of order  $p^k m$  where  $p$  is a prime not dividing  $m$  i.e.  $p \nmid m$ . Then  $\exists$  a Sylow  $p$ -subgroup of  $G$  of order  $p^k$ , i.e.  
 $Syl_p(G) \neq \emptyset$

(ii) Sylow Theorem 2: If  $P$  is a Sylow  $p$ -subgroup of  $G$  &  $Q$  is any  $p$ -subgroup of  $G$ , then  $\exists$   $g \in G$  s.t.  $Q \subseteq gPg^{-1}$  i.e.  $Q$  is contained in some conjugate of  $P$ .

In particular, Any two Sylow  $p$ -subgroups are conjugate in  $G$ .

(iii) Sylow Theorem 3: The no. of distinct Sylow  $p$ -subgroups divides  $|G|$  & is of the form  $kp+1$   
 i.e.  $n_p = kp+1$   
 or  $n_p \equiv 1 \pmod{p}$   
 i.e.  $n_p \equiv 1 \pmod{N_G(P)}$

Corollary: A sylow  $p$ -subgrp is normal iff it is unique.

Pf: (1) let  $G$  be a grp of order  $p^{\alpha}m$  s.t  $p \nmid m$   
let  $P$  be a sylow  $p$ -subgrp of  $G$  then  
 $|P| = p^{\alpha}$

Given: —

Sylow  $p$ -subgrp is unique.

Now for  $g \in G$ ,  $gPg^{-1} \subseteq G$

$$\& |gPg^{-1}| = |P| = p^{\alpha}$$

$\Rightarrow gPg^{-1}$  is also a sylow  $p$ -subgrp of  $G$ .

as there is only one sylow  $p$ -subgrp of  $G$ .

$$\Rightarrow gPg^{-1} = P \quad \forall g \in G.$$

$$\Rightarrow P \triangleleft G.$$

$\Leftarrow$  let  $P \triangleleft G$ .

T.P  $P$  is unique.

let  $Q$  be any other sylow  $p$ -subgroup of  $G$  then by sylow theorem 2  $\Rightarrow$

$$\exists g \in G \text{ s.t } Q = gPg^{-1}$$

$$\& Q = gPg^{-1} = P \quad \forall g \in G.$$

$$\therefore P \triangleleft G.$$

$$\Rightarrow Q = P$$

$\Rightarrow$  Sylow  $p$ -subgrp is unique.

(2)

$P$  is normal in  $G \Leftrightarrow$  All subgrps generated by elts of  $P$ -power order are  $p$ -groups  
i.e if  $x$  is any subset of  $G$  s.t  $|x| = \text{power of } p$   
 $\forall x \in x$  then  $\langle x \rangle$  is a  $p$ -group.

Pf:

let  $x$  be any subset of  $G$  s.t

$$|x| = \text{power of } p \quad \forall x \in x.$$

Then by Sylow thm-2, for

Each  $x \in X$ .  $\exists g \in G$  s.t.  $x \in gPg^{-1} = P \because P \Delta H$   
 $\Rightarrow x \in P$

$\Rightarrow \langle x \rangle \leq P$  &  $\langle x \rangle$  is a  $p$ -group.

$\Leftarrow$

Let  $\langle x \rangle$  is a  $p$ -group.

Let  $X$  be the union of all Sylow  $p$ -subgroups of  $G$ .

$P$  is a Sylow  $p$ -subgroup of  $G$ .

$\Rightarrow P \subseteq \langle x \rangle$

Since,  $P$  is a  $p$ -subgroup of  $G$  of maximal order

$\Rightarrow \langle x \rangle = P$

$\Rightarrow P$  is the unique Sylow-subgroup.  $P \Delta G$ .

(iii)

### APPLICATION OF 'SYLOW' THRM

**Theorem:** If  $|G| = pq$  with  $p \neq q$  primes with  $p < q$  &  
 $p \nmid (q-1)$  then  $G$  is cyclic.

(24-7)  
 2014

Pf:

As  $p < q$  &  $p \nmid q-1$

$\Rightarrow q \nmid p-1$

Now,  $|G| = pq \Rightarrow p \mid |G|$  but  $p^2 \nmid |G|$

$\therefore G$  has Sylow  $p$ -subgroups of order  $p$ .

$\therefore$  By Sylow theorem —

No. of distinct Sylow  $p$ -subgroups is of the form  $1+kp$ , ( $k \geq 0$ )

i.e.  $n_p = 1+kp$

$\Rightarrow 1+kp \mid |G| \Rightarrow 1+kp \mid pq$

As  $(1+kp, p) = 1 \Rightarrow 1+kp \mid q$

$\Rightarrow 1+kp = 1$  or  $q$

Now,  $1+kp = 1 \Rightarrow k = 0$  or  $1+kp = q$

$\Rightarrow kp = q-1 \Rightarrow p \mid q-1$

not possible (given)

$$1 + kp = 1 \Rightarrow k = 0$$

$\Rightarrow \exists$  only one Sylow  $p$ -subgroup of  $h$  say  $P$ .  
 $|P| = p$

Similarly  $\exists$  only one Sylow  $q$ -subgroup of  $h$   
 say  $Q$ .  
 $|Q| = q$

$A \& P$  is the unique Sylow  $p$ -subgroup of  $h$ .  
 $\Rightarrow P \triangleleft h$ .

Similarly  $Q$  is the unique Sylow  $q$ -subgroup  
 of  $h \Rightarrow Q \triangleleft h$ .

We'll now, show that  $P \cap Q = \{e\}$

Also,  $P \cup Q \subseteq P \& Q \subseteq P \cup Q$

$$\Rightarrow |P \cap Q| \mid |P| \& |P \cap Q| \mid |Q|$$

$$\Rightarrow |P \cap Q| \mid p \& |P \cap Q| \mid q \text{ as } (p, q) = 1$$

$$\Rightarrow |P \cap Q| = 1$$

$$\Rightarrow P \cap Q = \{e\}$$

Now,

$|P| = p \Rightarrow P$  is cyclic

$|Q| = q \Rightarrow Q$  is cyclic.

Every grp of prime order is cyclic

Let  $P = \langle x \rangle$  for  $x \in h$

$Q = \langle y \rangle$ ,  $|x| = p$ ,  $|y| = q$

We'll prove that  $x$  &  $y$  commute.

Consider,  $xyx^{-1}y^{-1} = (xyx^{-1})y^{-1} \in Q \because Q \triangleleft h$

$xyx^{-1}y^{-1} = x(x^{-1}(yx^{-1}y^{-1})) \in P \because P \triangleleft h$ .

$$\Rightarrow \cancel{xyx^{-1}y^{-1}} \in P \cap Q = \{e\}$$

$$\Rightarrow xyx^{-1}y^{-1} = e \Rightarrow xy = yx$$

$$\Rightarrow |xy| = |x||y| = pq = |h|$$

$\Rightarrow G = \langle xy \rangle \Rightarrow h$  is a cyclic grp generated by  $xy$ .

and as  $G$  is a cyclic grp of order  $pq$ .  
 $\Rightarrow G \cong \mathbb{Z}_{pq}$ .

Ques Prove that every grp of order 15 is cyclic.

$$|G| = 15 = 3 \cdot 5$$

$$p=3, \quad p < q$$

$$3 \nmid 4$$

$$q=5, \quad q \nmid p-1$$

$\Rightarrow$  by above thm,  $G$  is cyclic.

Ques

Prove that if  $|G| = p^2q$  where  $p$  &  $q$  are distinct primes with  $p > q$  then  $G$  has a normal subgroup of order  $p^2$ .

$$|G| = p^2q$$

$$\Rightarrow p^2 \mid |G|$$

$\therefore$  Sylow  $p$ -subgroups are of order  $p^2$ .

$n_p =$  No. of distinct sylow  $p$ -subgroups that divides  $|G|$

$$\Rightarrow n_p = kp+1 \mid |G| \quad k \geq 0$$

$$\therefore kp+1 \mid p^2q$$

Now,

$$(kp+1, p^2) = 1$$

$$\Rightarrow (kp+1) \mid q$$

Now, if  $k \geq 1$  then  $kp+1 > p > q$

$$\therefore kp+1 > p > q$$

$\Rightarrow kp+1$  can't divide  $q$  if  $k \neq 0$ .

$$\therefore k=0 \quad \therefore n_p = 1$$

$\therefore$  Thus  $\exists$  a unique sylow  $p$ -subgroup say  $P$  of order  $p^2$  s.t.  $P \triangleleft G$ .

Case-II if  $|G| = p^2q$  where  $p$  &  $q$  are distinct prime with  $p < q$ . P.T then  $G$  has a normal subgroup of order  $q$  or  $|G| = 12$ .

Sol<sup>n</sup>

$$\text{as } |G| = p^2q$$

$\therefore G$  can have a sylow  $p$ -subgrp of order  $q$ .  
 $n_q = kq + 1$  is the no. of distinct sylow  
 $q$ -subgroups of  $G$ .

$$\Rightarrow (kq + 1) \mid |G| \Rightarrow (kq + 1) \mid p^2q$$

$$\text{As } (kq + 1, q) = 1 \Rightarrow (kq + 1) \mid p^2$$

$$\Rightarrow kq + 1 = 1 \text{ or } p \text{ or } p^2$$

(i)  $kq + 1 = 1 \Rightarrow k = 0 \Rightarrow \exists$  a unique sylow  
 $q$ -subgrp of order  $q$  say  $Q$ ,  $|Q| = q$ .

$$\Rightarrow [Q \triangleleft G] \quad \therefore Q \text{ is unique}$$

(ii)  $kq + 1 = p < q$  not possible ( $p < q$ )

(iii)  $kq + 1 = p^2$

$$\therefore kq = p^2 - 1 = (p-1)(p+1)$$

$$\therefore q \mid (p-1)(p+1) \quad \therefore q \mid p-1 \text{ or } q \mid p+1$$

$$\text{As } q > p \Rightarrow q \nmid p-1$$

$$\therefore q \mid p+1$$

$$\text{As, } q > p \Rightarrow q \geq p+1 \left\{ \begin{array}{l} q = p+1 \text{ consecutive} \\ \text{primes} \\ \therefore p = 2 \text{ \& } q = 3 \end{array} \right.$$

$$\Rightarrow |G| = p^2q = 12.$$

Que.

Show that a group of order 30 has normal  
 subgroup of order 15. (i.e. isomorphic to  $Z_{15}$ )

Sol<sup>n</sup>

$$|G| = 30 = 2 \cdot 3 \cdot 5$$

$\Rightarrow 3 \mid |G| \therefore G$  has sylow 3-subgrps of order <sup>3</sup>

$\Rightarrow n_3 =$  No. of distinct sylow 3-subgrps divides  $|G|$ .

$$\Rightarrow 3k + 1 \mid |G|, \quad k \geq 0$$

$$\Rightarrow 3k+1 \mid 2 \cdot 3 \cdot 5$$

$$(3k+1, 3) = 1 \Rightarrow (3k+1) \mid 10$$

$$\therefore 3k+1 = 1 \text{ or } 2 \text{ or } 5 \text{ or } 10.$$

$$3k+1 = 1 \Rightarrow k = 0$$

$$3k+1 = 2 \Rightarrow k = \frac{1}{3} \quad \text{not possible.}$$

$$3k+1 = 5 \Rightarrow k = \frac{4}{3} \quad \text{" "}$$

$$3k+1 = 10 \Rightarrow k = 3$$

$\Rightarrow$  There is either one or 10 distinct sylow 3-subgroups.

i.e.  $n_3 = 1 \text{ or } 10$

likewise  $n_5 = 1 \text{ or } 6$

$$(5k+1) \mid 6 \Rightarrow 5k+1 \text{ or } 2 \text{ or } 3 \text{ or } 6$$

$$\Rightarrow 5k+1 = 1 \Rightarrow k = 0$$

$$5k+1 = 6 \Rightarrow k = 1$$

If possible suppose  $n_3 = 10$  &  $n_5 = 6$ .

$\Rightarrow \exists$  10 distinct sylow 3-subgroups.  $P_1, P_2, \dots, P_{10}$ .

$\exists$  6 5-subgroups,  $Q_1, Q_2, \dots, Q_6$ .

$\therefore |P_i| = 3 \Rightarrow$  Every non-identity elt. of  $P_i$  is of order 3. There are 2 non-identity elts in each  $P_i$ ,  $i = 1, 2, \dots, 10$ .

$\Rightarrow$  No. of distinct elts of order 3 =  $10 \times 2 = 20$ .

likewise  $5 = 6 \times 4 = 24$ .

$$\text{Total} = 20 + 24 = 44 \text{ elts}$$

$$\Rightarrow |G| > 30$$

Not possible.

$$\Rightarrow n_3 \neq 10 \text{ \& } n_5 \neq 6$$

$$\Rightarrow n_3 = 1 \text{ or } n_5 = 1$$

$\Rightarrow \exists$  a unique sylow 3-subgroup say  $P$ .

$\exists$  a unique sylow 5-subgroup say  $Q$ .

$$\Rightarrow PQ < G \quad \& \quad Q < G.$$

$$\text{As } \boxed{P < G \ \& \ Q < G \Rightarrow PQ < G}$$

$$\text{Also, } |PQ| = \frac{|P||Q|}{|P \cap Q|} = \frac{3 \cdot 5}{1} = 15$$

$$\boxed{P \cap Q = \{e\}}$$

$$|G : PQ| = \frac{30}{15} = 2$$

$\therefore PQ < G$  [Every subgroup of index 2 is normal in  $G$ ]

$$|PQ| = 15 - \text{cyclic} \\ \approx \mathbb{Z}_{15}$$

### \* Index Theorem :

If  $G$  is a finite group &  $H$  is a proper subgroup of  $G$  s.t.  $|G|$  doesn't divide  $|H|!$ , then  $H$  contains a non-trivial normal subgroup of  $G$ . In particular,  $G$  is not simple.

Result: - 2-odd Test: - An integer of the form  $2 \cdot n$  where  $n$  is an odd no. greater than 1, is not the order of a simple group.

Que:

Prove that a grp. of order 56 has a normal sylow  $p$ -subgrp for prime  $p$  dividing its order.

soln: -

$$|G| = 56 = 2^3 \cdot 7$$

Then  $G$  has sylow 2-subgrps of order  $2^3 = 8$

$G$  has sylow 7-subgrp of order = 7

$n_7 =$  no. of distinct sylow 7-subgrps of order 7 that divides  $|G|$ .

$$\Rightarrow (7k+1) \mid 56, \quad k \geq 0$$

$$\Rightarrow (7k+1) \mid 2^3 \cdot 7$$

$$n_7 = (7k+1) \mid 7 = 1$$

$$\Rightarrow (7k+1) \mid 2^3$$

$$\Rightarrow (7k+1) \mid 8 \Rightarrow 7k+1 = 1 \text{ or } 2 \text{ or } 4 \text{ or } 8$$

$$\Rightarrow 7k+1 \neq 2 \text{ or } 4$$

$$\Rightarrow 7k+1 = 1 \text{ or } 7k+1 = 8$$

$$n_7 = 1 \text{ or } 8$$

$$\Rightarrow k = 0 \text{ or } 1$$

$n_2 =$  No. of distinct sylow 2-subgroups of order 8

$$\Rightarrow (2k+1) \mid |G| \Rightarrow (2k+1) \mid 2^3 \cdot 7$$

$$\Rightarrow (2k+1, 8) = 1$$

$$\Rightarrow (2k+1) \mid 7$$

$$\Rightarrow 2k+1 = 1 \text{ or } 7$$

$$\Rightarrow k = 0 \text{ or } k = 3$$

$$\Rightarrow n_2 = 1 \text{ or } 7$$

We ~~have~~ prove that  $n_2 \neq 7$  &  $n_7 \neq 8$

$$\text{if } n_2 = 7 \text{ \& } n_7 = 8,$$

There are 7-sylow 2-subgroups say  $H_1, H_2, \dots, H_7$   
 8-sylow 7-subgroups  $K_1, K_2, \dots, K_8$

As all ~~the~~ are distinct &

$$|H_i| = 8, |K_j| = 7$$

$|K_j| = 7 \Rightarrow$  there are 6 non-identity elts of order 7.

$$\Rightarrow \text{No. of elts of order 7} = 8 \times 6 = 48$$

Consider  $H_i$ ,

if  $x \in H_i, 1 \leq i \leq 7$

then  $|x| = 2^\alpha, 0 \leq \alpha \leq 3, \because |H_i| = 2^3$ .

Consider  $H_1 \cap H_2$ , since  $H_1 \neq H_2$

$$\Rightarrow |H_1 \cap H_2| = 2^\beta, 0 \leq \beta \leq 2$$

$$|H_1 \cup H_2| = |H_1| + |H_2| - |H_1 \cap H_2|$$

$$= 2^3 + 2^3 - 2^\beta$$

$$= 16 - 2^\beta \geq 12$$

$\Rightarrow G$  has at least 12 elts of order in powers of 2.  
 $\Rightarrow G$  has at least  $12+48=60$  non-identity elts.

But  $|G|=56 < 60$  Contradiction

$$\Rightarrow n_2 \neq 7 \text{ or } n_7 = 8$$

$\Rightarrow G$  has either one Sylow 2-subgrp or has only 1 Sylow 7-subgrp.

$\Rightarrow G$  is not simple

$$\text{or } n_2 = 1 \text{ or } n_7 = 1$$

$\Rightarrow$  it has a unique Sylow 2-subgrp  $P$  (say)  
 $\therefore P \triangleleft G$ .

or it has a unique Sylow 7-subgrp  $Q$  (say)  
 $\Rightarrow Q \triangleleft G$ .

(w)

Que-17  $|G|=105$ . Then  $G$  has a normal Sylow 5-subgrp & a normal Sylow 7-subgrp.

(Ex-4-5)  
 Soln:-

$$|G|=105 = 3 \cdot 5 \cdot 7$$

It has Sylow 3-subgrps of order 3.

$$\begin{array}{ccc} \text{-----} & 5 & \text{-----} & 5 \\ \text{-----} & 7 & \text{-----} & 7 \end{array}$$

$n_5 =$  no. of distinct Sylow 5-subgrps of order 5.

$n_7 =$  no. of distinct Sylow 7-subgrps of order 7

$$\Rightarrow n_5 = (5k+1) \mid |G|$$

$$n_7 = (7k+1) \mid |G|$$

$$\Rightarrow (5k+1) \mid 3 \cdot 5 \cdot 7 \text{ or } (5k+1, 5) = 1$$

$$\Rightarrow (5 \cdot k+1) \mid 3 \cdot 7 = 21$$

$$\text{Hence } (7k+1) \mid 15$$

$$\Rightarrow 5k+1 = 1 \text{ or } 3 \text{ or } 7 \text{ or } 21$$

$$5k+1 \neq 3 \text{ or } 7$$

$$\Rightarrow 5k+1 = 1 \text{ or } 21$$

Similarly,  $7k+1 = 1 \text{ or } 15$

Now  $n_7 = 1 \text{ or } 15$ ,  $n_5 = 1 \text{ or } 21$

If  $n_7 = 15$ , &  $n_5 = 21$

$\Rightarrow \exists 15$  distinct Sylow 7-subgroups

$$H_1, H_2, \dots, H_{15}$$

$\exists 21$  distinct Sylow 5-subgroups

$$K_1, K_2, \dots, K_{21}$$

$$\Rightarrow |H_i| = 7 \quad \& \quad |K_j| = 5$$

Every  $H_i$  has 6 non-identity elts of order 7.  
Every  $K_j$  has 4 non-identity elts of order 5.

$$\exists 6 \times 15 = 90 \text{ elts of order 7.}$$

$$\& \exists 4 \times 21 = 84 \text{ elts of order 5.}$$

$$\Rightarrow 90 + 84 = 174 \text{ elts of } n.$$

not possible.

$$\Rightarrow \text{either } n_5 = 1 \text{ or } n_7 = 1$$

If  $n_5 = 1$ :

$\Rightarrow \exists$  a unique Sylow 5-subgroup of order 5 say  $P$ .

$\exists$  a unique Sylow 7-subgroup of order 7 say  $Q$ .

Now,

$$P \triangleleft n \quad \& \quad Q < n, \quad P \cap Q = \{e\}$$

Then  $PQ < n$

$$|PQ| = \frac{|P||Q|}{|P \cap Q|} = \frac{5 \cdot 7}{1} = 35$$

$$|n : PQ| = \frac{105}{35} = 3$$

PQ  $\Delta$ h

Page No.	194
Date	

Now PAh & PQ  $\Delta$ h  $\Rightarrow$  Q  $\Delta$ h

(Ex-405)

11<sup>ry</sup> for  $n_7 = 1$ .

Que ⑥

Exhibit all sylow 3-subgroups of  $S_4$  & all sylow 3-subgroups of  $A_4$ .

(Ex-405)

$S_4$

$$|S_4| = 24 = 2^3 \cdot 3$$

$$|A_4| = 12 = 2^2 \cdot 3$$

$A_4$  &  $S_4$  has sylow 3-subgroups of order 3

Qn  $A_4$  :-

$n_3 = 3k+1 =$  no. of distinct sylow 3-subgroups of order 3.

$$(3k+1) \mid 12 \quad \Rightarrow \quad (3k+1) \mid 4 \cdot 3$$

$$\Rightarrow (3k+1) \mid 4$$

$$\Rightarrow 3k+1 = 1 \text{ or } 4$$

$$n_3 = 1 \text{ or } 4.$$

There can be 4 sylow 3-subgroups of order 3.

$$A_4 = \{ I, (123), (132), (124), (142), (134), (143), (234), (243), (12)(34), (14)(23), (13)(24) \}$$

$$\langle (123) \rangle = \{ I, (123), (132) \}$$

$$\langle (124) \rangle = \{ I, (124), (142) \}$$

$$\langle (134) \rangle = \{ I, (134), (143) \}$$

$$\langle (234) \rangle = \{ I, (234), (243) \}$$

All 4 sylow 3-subgroups of  $A_4$ .

Qn  $S_4$  :  $n_3 = 1 \text{ or } 4 \text{ or } 8$

but  $3k+1 \neq 8 \quad \because k = 7/3$  not possible

$S_4$  has 4, sylow 3-subgroups of order 3.  
(same as  $A_4$ ).

\*  $A_4$  has a unique sylow 2-subgrp.

$$|A_4| = 12 = 2^2 \cdot 3$$

$n_2 = 2k+1$  are distinct sylow 2-subgroups

$$(2k+1) \mid 3 \Rightarrow 2k+1 = 1 \text{ or } 3$$

$$\begin{array}{l|l} 2k+1 = 1 & 2k+1 = 3 \\ \Rightarrow k = 0 & \Rightarrow k = 1 \end{array}$$

Let  $P$  be the sylow 2-subgroup of  $A_4$  of order 4.

$$P = \{ I, (12)(34), (13)(24), (14)(23) \}$$

$\Rightarrow P \triangleleft A_4$ . Hence Unique.

(Ex-4.5)

Ques Exhibit all sylow 2-subgroups of  $S_4$ .

$$|S_4| = 24 = 2^3 \cdot 3$$

$n_2 = 2k+1 =$  no. of distinct sylow 2-subgroups of order 8.

$$(2k+1) \mid |S_4| \Rightarrow (2k+1) \mid 2^3 \cdot 3$$

$$\Rightarrow (2k+1) \mid 3$$

$$\Rightarrow 2k+1 = 1 \text{ or } 3$$

$$n_2 = 3$$

Let  $P_1, P_2, P_3$  be sylow 2-subgroups of order 8.

Since  $S_4$  contains a subgroup of  $S_4$  is isomorphic to  $D_8$ .

 $|G| \geq 2$ .

(i) ~~(i)~~ If  $|G| = 2$   
 then  $G$  contains an elt. of order 2.  
 $x \in G, x \neq e, \text{ s.t. } x^2 = e$ .

(ii) Now, let us assume that result is true for all grps. with order less than  $|G|$ . i.e for any grp. whose order is less than  $|G|$  of  $p$  divides its order then  $\exists$  an elt. of order  $p$ .

Case-I, If  $G$  has no proper subgrp. then  $|G|$  is prime.

$$\Rightarrow p \mid |G| \Rightarrow p = |G|$$

then  $G$  is a cyclic grp.

$$\Rightarrow \exists x \in G \text{ s.t. } x^p = e \quad (x \neq e)$$

Case-II, let  $G$  has a proper subgrp.  $H$ .

Then  $H \neq \{e\} \triangleleft H \triangleleft G$

If  $p \nmid |H|$  where  $H < G \Rightarrow |H| \nmid |G|$   
 $\Rightarrow |H| \nmid |G|$

by our assumption result is true for  $H$ .

$\Rightarrow \exists$  an elt. other than identity in  $H$ , i.e.  $e \neq a \in H \Rightarrow a^p = e$ .

If  $p \nmid |H|$ , then  $G$  is abelian &  $H \leq G \Rightarrow H \triangleleft G$  &  $G/H$  is defined & in an abelian group.

Also,  $\left| \frac{G}{H} \right| = \frac{|G|}{|H|} < |G|$ , Now,  $p \nmid |G|$  &  $p \nmid |G| \Rightarrow p \nmid \left| \frac{G}{H} \right|$

Then,

by our assumption result is true for  $\frac{G}{H}$ .  $\therefore \exists$  an elt.  $bH \in \frac{G}{H}$  ( $bH \neq H$ )

s.t.  $(bH)^p = H$

$$\Rightarrow b^p H = H \Rightarrow b^p \in H$$

$$\Rightarrow (b^p)^{|H|} = e \Rightarrow (b^{|H|})^p = e$$

$$\Rightarrow a^p = e \quad \text{where } b^{|H|} = a \in G.$$

We claim that  $a \neq e$

$$\text{if } a = e \Rightarrow b^{|H|} = e$$

$$\Rightarrow (bH)^{|H|} = b^{|H|} H = H$$

$$\Rightarrow |bH| \mid |H| \Rightarrow p \mid |H|$$

- Contradiction

$$\Rightarrow a \neq e \triangleleft a^p = e$$

Def<sup>n</sup>: Simple Group :-

A finite or infinite group is called simple if  $|G| > 1$  & the only normal subgroup of  $G$  is  $\{e\}$  &  $G$ .

Note: - Every grp of prime order is simple.

Pf: let  $G$  be a grp of prime order.  
 $|G| = p$

Let  $H \leq G$

Then  $|H| \mid p \Rightarrow |H| = 1$  or  $p$

$\Rightarrow H = \{e\}$  or  $H = G$

$\therefore G$  is a simple group.

Defn: Composition Series :-

In a group  $G$ , a sequence of subgroups.

$$\{e\} = N_0 \leq N_1 \leq N_2 \leq \dots \leq N_{k-1} \leq N_k = G$$

is called a Composition Series if

$$N_i \triangleleft N_{i+1} \text{ \& } \frac{N_{i+1}}{N_i} \text{ is a simple grp.}$$

for  $0 \leq i \leq k-1$

The quotient group  $\frac{N_{i+1}}{N_i}$  is called Composition factors of  $G$ .

Ex-  $D_4 = \{1, r, r^2, r^3, s, rs, rs^2, rs^3 \mid r^4 = \frac{1}{2} = s^2, rs = s^{-1}r\}$

$$\langle s \rangle = \{1, s\}$$

$$\langle s, r^2 \rangle = \{1, s, r^2, sr^2\}$$

$$\text{Here } \{1\} \triangleleft \langle s \rangle \triangleleft \langle s, r^2 \rangle \triangleleft D_4$$

$$\{1\} \triangleleft \langle r^2 \rangle \triangleleft \langle r \rangle \triangleleft D_4$$

There are 2 Composition Series for  $D_4$ .

Que: Obtain the Composition series of  $Q_8$ .

$$Q_8 = \{1, -1, i, -i, j, -j, k, -k\}$$

$$i^2 = -1 = (-i)^2$$

$$i \cdot j = k = -j \cdot i$$

$$j^2 = -1 = (-j)^2$$

$$j \cdot k = i = -k \cdot j$$

$$k^2 = -1 = (-k)^2$$

$$k \cdot i = j = -i \cdot k$$

Page No.	157
Date	

Consider —

$$N_0 = \{1\}$$

$$N_1 = \{1, -1\}$$

$$N_2 = \{1, -1, i, -i\}$$

$$N_3 = \mathbb{Q}_8$$

$$\boxed{\{1\} = N_0 \leq N_1 \leq N_2 \leq N_3 = \mathbb{Q}_8}$$

$\triangleleft N_0 \triangleleft N_1,$   
 $N_1 \triangleleft N_2, N_2 \triangleleft N_3$

$\frac{N_1}{N_0}, \frac{N_2}{N_1}, \frac{N_3}{N_2}$  are simple grps

(2)  $N_0 = \{1\}$

$$N_1 = \{1, -1\}$$

$$N_2 = \{1, -1, j, -j\}$$

$$N_3 = \mathbb{Q}_8$$

(3)  $N_0 = \{1\}$

$$N_1 = \{1, -1\}$$

$$N_2 = \{1, -1, k, -k\}$$

$$N_3 = \mathbb{Q}_8.$$

Que.

Give an example of an infinite grp which has no composition series.

⊗

Pf:

Consider  $(\mathbb{Z}, +)$

let if possible  $\mathbb{Z}$  has a composition series.

let  $\{0\} = N_0 \leq N_1 \leq \dots \leq N_k = \mathbb{Z}$  be the composition series for  $\mathbb{Z}$ . s.t

$N_i \triangleleft N_{i+1} \triangleleft \frac{N_{i+1}}{N_i}$  is ~~same~~ simple.

$$\text{Now, } \left| \frac{N_1}{N_0} \right| = |N_1|$$

$$\Rightarrow \frac{N_1}{N_0} \cong N_1 \text{ as } \frac{N_1}{N_0} \text{ is simple.}$$

$$\Rightarrow N_1 \text{ is also simple.}$$

$\Rightarrow N_1$  has only 2 normal subgrps  $\{0\}$  &  $N_1$  itself.

Now as  $N_1$  is a subgroup of  $\mathbb{Z}$  &  $\mathbb{Z}$  is cyclic.

$\Rightarrow N_1$  is also cyclic.

let  $N_1 = \langle k \rangle$  f.s  $k \in \mathbb{Z}$

Then  $H = \langle 2k \rangle$  is a normal subgrp of  $N_1$

$H \neq N_1 \Rightarrow$  contradiction as  $N_1$  is simple.

Thm (22)

## # JORDAN-HOLDER THM: — (Thm-22)

Let  $G$  be a finite group with  $1 \neq \{e\}$ . Then

- (i)  $G$  has a Composition series &  
 (ii) The composition factors in a composition series are unique, namely if -

$$\{e\} = N_0 \leq N_1 \leq N_2 \leq \dots \leq N_r = G$$

$$\{e\} = M_0 \leq M_1 \leq M_2 \leq \dots \leq M_s = G$$

are 2 composition series for  $G$  then  $r = s$   
 & for every  $1 \leq i \leq r-1$ ,  $\exists j$  s.t

$$\frac{M_{j+1}}{M_j} \cong \frac{N_{i+1}}{N_i}$$

(if not required)

## Def: Solvable Groups: —

A group  $G$  is solvable if there is a chain of subgroups.

$$\{e\} = G_0 \triangleleft G_1 \triangleleft G_2 \leq \dots \triangleleft G_s = G$$

s.t  $\frac{G_{i+1}}{G_i}$  is an abelian group for  $i = 0, 1, 2, \dots, s-1$

Result: Show that every abelian group is solvable.

Sol<sup>n</sup>

Let  $G$  be an abelian group.

Consider  $G_0 = \{e\}$ ,  $G_1 = G$   
 $\{e\} \triangleleft G$

$$\text{Also, } \left| \frac{G_1}{G_0} \right| = \frac{|G_1|}{|G_0|} = |G| \quad \therefore \frac{G_1}{G_0} \cong G$$

Since  $G$  is abelian  $\Rightarrow \frac{G_1}{G_0}$  is abelian

$\Rightarrow G$  is solvable.

Result: Every cyclic group is solvable.

Result: Let  $G$  be a non-abelian simple group. Show that  $G$  is not-solvable.

Page No.	159
Date	

Prf: —  $A_5$  is a simple grp.

$\therefore$  the only normal subgroups are  $\{e\}$  &  $G$ .

Also,  $\frac{G}{\{e\}} \cong G$ .  $A_5$  is non-Abelian.

$\Rightarrow \frac{G}{\{e\}}$  is non-Abelian.

$\Rightarrow G$  is not solvable.

Coro:  $A_5$  is not solvable. ( $\because A_5$  is a non-Abelian simple-grp)

Que-1 Show that  $S_3$  &  $S_4$  are solvable.

We know that  $I \leq A_3 \leq S_3$ .

Also,  $I \triangleleft A_3 \triangleleft A_3 \triangleleft S_3$ .

$$\left| \frac{S_3}{A_3} \right| = 2 = \text{Prime}$$

Every group of Prime order is cyclic.

Hence abelian.

$\therefore \left| \frac{A_3}{I} \right| = 3 = \text{Prime} \Rightarrow \frac{A_3}{I}$  is also abelian.

$\Rightarrow S_3$  is solvable.

Prf: Consider  $K_4 = \{I, (12)(34), (13)(24), (14)(23)\}$

$$I \triangleleft K_4 \triangleleft A_4 \triangleleft S_4$$

abelian.

$$\left| \frac{S_4}{A_4} \right| = \frac{24}{12} = 2 = \text{Prime. Hence } \frac{S_4}{A_4} \text{ is abelian.}$$

$$\left| \frac{A_4}{K_4} \right| = \frac{12}{4} = 3 = \text{Prime. Hence } \frac{A_4}{K_4} \text{ is abelian.}$$

$\left| \frac{K_4}{I} \right| = 4 = 2^2$  — every grp of order  $p^2$  is abelian.

$\Rightarrow \frac{K_4}{I}$  is abelian.

$\Rightarrow S_4$  is solvable.

Que: 7 Prove that if  $G$  is an abelian simple grp. then

(Ex-34)  $G \cong \mathbb{Z}_p$  for some prime  $p$ .

Pf: As  $G$  is abelian  $\Rightarrow$  All its subgrps are normal.

But as  $G$  is simple.

$\Rightarrow$  There are only 2 normal subgrps of  $G$ .  
 $\{e\}$  &  $G$  itself.

But we know that if  $G$  is infinite then all distinct elts will generate a subgroup.

$\Rightarrow G$  can't be infinite.

$\Rightarrow G$  must be finite.

$\therefore$  By ~~converse~~ converse of Lagrange's thm —  
 for finite abelian group. If  $|G| = n$  not a  
 prime then it will have subgrps which is a  
 contradiction as  $G$  has only 2 normal subgrps.

$\Rightarrow |G| = p \Rightarrow G$  is cyclic grp of order  $p$ .

$\Rightarrow G \cong \mathbb{Z}_p$ .

Que: 8 Prove that subgrps & quotient of a solvable  
 (Ex-34) grp are solvable.

Pf: To prove this result, we have to prove

Let  $G$  be a group. &

$x^{-1}y^{-1}xy$  is a commutator in  $G$ .

&  $G' =$  subgroup generated by  $\{x^{-1}y^{-1}xy : x, y \in G\}$

Every elt. of  $G'$  is of the form

$p_1^{a_1} p_2^{a_2} \dots p_m^{a_m}$  where each  $p_k$  is a commutator

Then  $G'$  is called a commutator subgroup of  $G$ .

Also  $G' \triangleleft G$  &  $G'$  is the smallest normal subgroup

s.t.  $\frac{G}{G'}$  is abelian if  $N \triangleleft G$  s.t.  $\frac{G}{N}$  is

abelian then —  
 $G' \subseteq N$  — (\*)

Page No.	161
Date	

Theorem A Group  $G$  is solvable iff  $G^{(n)} = \{e\}$  for some +ve integer  $n$  where  $G^{(n)}$  is the  $n$ th commutator subgroup of  $G$ .

$G^{(2)} = (G')'$   
 $G^{(3)} = (G^{(2)})'$

pf: Let  $G$  be a solvable then,  $\exists$  series say  $\{e\} = G_0 \subseteq G_1 \subseteq G_2 \subseteq \dots \subseteq G_n = G$  where each  $G_i \triangleleft G_{i+1}$  &  $\frac{G_{i+1}}{G_i}$  is abelian.

Now,  $\frac{G_n}{G_{n-1}}$  is abelian i.e.  $\frac{G}{G_{n-1}}$  is abelian  $\Leftarrow G_{n-1} \triangleleft G$

Then  $G' \subseteq G_{n-1}$  by (\*)

$$\Rightarrow (G')' \subseteq G'_{n-1} \Rightarrow G^{(2)} \subseteq G'_{n-1}$$

Again  $\frac{G_{n-1}}{G_{n-2}}$  is abelian &  $G_{n-2} \triangleleft G_{n-1}$   
 $\Rightarrow G'_{n-1} \subseteq G_{n-2}$   
 $\Rightarrow G^{(2)} \subseteq G_{n-2}$

Similarly  $G^{(3)} \subseteq G_{n-3}$   
 $G^{(n)} \subseteq G_0 = \{e\} \Rightarrow G^{(n)} = \{e\}$ .

$\Leftarrow$  Suppose,  $G^{(n)} = \{e\}$  f.s. +ve integer 'n'.

Consider the series  $G' \subseteq G \Leftrightarrow (G')' \subseteq G'$   
 $\Rightarrow G^{(2)} \subseteq G^{(1)}$

$$\Rightarrow (G^{(2)})' \subseteq (G')'$$

$$\Rightarrow G^{(3)} \subseteq G^{(2)}$$

$$\Rightarrow \{e\} = G^{(n)} \subseteq G^{(n-1)} \subseteq \dots \subseteq G' \subseteq G.$$

As,  $G' \triangleleft G \Rightarrow G^{(i)} \triangleleft G^{(i-1)}$

$$\Rightarrow \frac{G^{(i-1)}}{G^{(i)}} \text{ is abelian.}$$

$\Rightarrow G$  is solvable.

# 3.1 Every subgroup of a solvable grp is solvable.

Pf: let  $H$  be a subgroup of a solvable group  $G$ .  
 Since  $G$  is solvable.

$$\Rightarrow G^{(n)} = \{e\} \quad \forall n \in \mathbb{N}$$

$$\text{As } H \subseteq G \Rightarrow H' \subseteq G' \Rightarrow (H')' \subseteq (G')'$$

$$\Rightarrow H^{(n)} \subseteq G^{(n)} = \{e\}$$

$$\Rightarrow H^{(n)} = \{e\} \Rightarrow H \text{ is solvable.}$$

Result: Quotient group of a solvable grp. is solvable.

Pf: let  $G$  be a solvable grp. &  $H \triangleleft G$ . Then  $\frac{G}{H}$  is a quotient grp.

Define  $\phi: G \rightarrow G/H$  as  $\phi(g) = gH \quad \forall g \in G$ .

$\phi$  is an onto H.M

$\Rightarrow$  As Homomorphic image of a solvable grp is solvable.

$$\Rightarrow \frac{G}{H} \text{ is also solvable.}$$

Theorem A simple group is solvable iff  $G$  is Abelian.

Pf: If  $G$  is Abelian & simple  $\Rightarrow G$  is solvable

$\Leftarrow$  Let  $G$  be simple and solvable.

As  $G' \triangleleft G$  &  $G$  is simple.

$$\therefore G' = \{e\} \text{ or } G' = G$$

As  $G$  is solvable by lemma

$$G' \neq G$$

(Ex 3.4)  $\therefore G' = \{e\} \Rightarrow G$  is Abelian

$$x^{-1}y^{-1}xy \in G' = \{e\}$$

$$\Rightarrow x^{-1}y^{-1}xy = \{e\}$$

$$\Rightarrow xy = yx$$

$$\Rightarrow G \text{ is Abelian}$$

Q.8

Theorem Let  $G$  be a finite group. Show that  $G$  is solvable iff  $\exists$  a series of subgroups  $\{e\} = H_0 \triangleleft H_1 \triangleleft \dots \triangleleft H_n = G$  s.t.  $\frac{H_i}{H_{i-1}}$  is cyclic.

Let  $G$  be solvable. Since  $G$  is finite

Page No.	163
Date	

$\therefore$  if has a composition series,

$$\{e\} = H_0 \triangleleft H_1 \triangleleft \dots \triangleleft H_n = G \quad \text{where } H_i \triangleleft H_{i+1}$$

$\&$   $\frac{H_{i+1}}{H_i}$  is simple.

Now,  $G_2$  is solvable  $\Rightarrow H_i$  is solvable  $\forall i$ .

$\Rightarrow \frac{H_{i+1}}{H_i}$  is solvable [Quotient grp. of solvable grp is solvable]

$\Rightarrow \frac{H_{i+1}}{H_i}$  is simple & solvable.

$\Rightarrow \frac{H_{i+1}}{H_i}$  is Abelian.

$\therefore$  All subgroups of  $\frac{H_{i+1}}{H_i}$  are normal.

Since,  $\frac{H_{i+1}}{H_i}$  is simple.

It has no non-trivial proper subgrps.

i.e.  $\frac{H_{i+1}}{H_i}$  has only 2 normal subgrps.

$\Rightarrow \left| \frac{H_{i+1}}{H_i} \right|$  is prime.

$\Rightarrow$  As every grp. of prime order is cyclic.

$\Rightarrow \frac{H_{i+1}}{H_i}$  is a cyclic grp.

$\Leftarrow$  Conversely As  $\frac{H_{i+1}}{H_i}$  is cyclic.

$\Rightarrow \frac{H_{i+1}}{H_i}$  is abelian.

$\Rightarrow G_2$  is solvable.

(iii) All composition factors of  $G_2$  are of prime order

As proved (earlier)

Above  $\frac{H_{i+1}}{H_i}$  is of prime order.

(iv) As  $G_2$  has a composition series,

$$\Rightarrow 1 = H_0 \triangleleft H_1 \triangleleft H_2 \dots \triangleleft H_n = G_2 \text{ s.t. } H_i \triangleleft H_{i+1}$$

$\& \frac{H_{i+1}}{H_i}$  is cyclic.

As every cyclic grp is abelian.

$\Rightarrow \frac{H_{i+1}}{H_i}$  is abelian.

(Ch-6, Prop 10 I)

Theorem let  $H \triangleleft G$ . If both  $H$  &  $\frac{G}{H}$  are solvable then  $G$  is solvable.

Pf: - let  $\frac{G}{H} = \frac{G_0}{H} \supseteq \frac{G_1}{H} \supseteq \frac{G_2}{H} \supseteq \dots \supseteq \frac{G_{m-1}}{H} \supseteq \frac{G_m}{H} = \{e\}$  — (1)

be a solvable series for  $G/H$ .

Here each  $G_i$  is subgroup of  $G$  containing  $H$ .

Since  $\frac{G_{i+1}}{H} \triangleleft \frac{G_i}{H}$

$\Rightarrow G_{i+1} \triangleleft G_i$

Also,  $\frac{G_m}{H} = \{e\} \Rightarrow G_m = H$

Now, let  $\{e\} = H_m \subseteq H_{m-1} \subseteq H_{m-2} \subseteq \dots \subseteq H_1 \subseteq H_0 = H$  — (2)

be a solvable series for  $H$ .

Then  $\{e\} = H_m \subseteq H_{m-1} \subseteq \dots \subseteq H_1 \subseteq H_0 = H = G_m \subseteq G_{m-1}$

$\subseteq G_{m-2} \subseteq \dots \subseteq G_0 = G$  is a solvable series

for  $G$ .

$\Rightarrow G$  is solvable.

(Ch-6, Prop 10 II)

Theorem P.T Homomorphic image of a solvable grp is solvable.

Pf: - let  $G$  be solvable grp.

let  $H$  be a homomorphic image of  $G$ . i.e

$\exists$  a homomorphism  $\phi: G \rightarrow H$  that is onto.

$\phi: G \rightarrow H$  is a H.M & onto

As  $G$  is solvable  $\Rightarrow \exists$  a true integer  $k$  s.t.  $G^{(k)} = \{e\}$

T.P

$H$  is solvable. we have to prove  $H^{(k)} = \{e'\}$

where  $e'$  is identity of  $H$ .

Now,  $x^{-1}y^{-1}xy \in G$ . Then  $x^{-1}y^{-1}xy$  is a commutator.  
 $\Rightarrow x^{-1}y^{-1}xy \in G'$ .

Then,

$$\begin{aligned}\phi(x^{-1}y^{-1}xy) &= \phi(x^{-1})\phi(y^{-1})\phi(x)\phi(y) \\ &= (\phi(x))^{-1}(\phi(y))^{-1}\phi(x)\phi(y)\end{aligned}$$

is again a commutator.

$$\Rightarrow \phi(x^{-1}y^{-1}xy) \in H'$$

$$\Rightarrow \phi(H) = H' \quad [\because \phi \text{ is onto}]$$

$$H^{(2)} = (H')' = (\phi(H))' = \phi(H^{(2)})$$

$$H^{(k)} = \phi(H^{(k)}) = \phi(\{e\}) = \{e\}$$

$$\Rightarrow H^{(k)} = \{e\}$$

$\Rightarrow H$  is solvable.

## External Direct Product

Let  $G_1, G_2, \dots, G_n$  be finite collection of groups.  
Then

$G_1 \oplus G_2 \oplus \dots \oplus G_n =$  set of the  $n$ -tuples of the  
the form  $\{(g_1, g_2, \dots, g_n) \mid g_i \in G_i\}$

$G_1 \oplus G_2 \oplus \dots \oplus G_n$  is a group under  
componentwise [addition or multiplication] operation

$$(g_1, g_2, \dots, g_n) (g'_1, g'_2, g'_3, g'_4, \dots, g'_n) = (g_1 g'_1, g_2 g'_2, \dots, g_n g'_n)$$

(i) Closure prop:

$$(g_1, g_2, \dots, g_n) (g'_1, g'_2, \dots, g'_n) = (g_1 g'_1, g_2 g'_2, \dots, g_n g'_n) \\ \in G_1 \oplus G_2 \oplus \dots \oplus G_n \\ \forall g_i, g'_i \in G_i$$

(ii) Associativity:

$$(g_1, g_2, \dots, g_n) (g'_1, g'_2, \dots, g'_n) (g''_1, g''_2, \dots, g''_n) \\ = (g_1 g'_1, g_2 g'_2, \dots, g_n g'_n) (g''_1, g''_2, \dots, g''_n) \\ = ((g_1 g'_1) g''_1, (g_2 g'_2) g''_2, \dots, (g_n g'_n) g''_n) \\ = (g_1 (g'_1 g''_1), g_2 (g'_2 g''_2), \dots, g_n (g'_n g''_n)) \\ = (g_1, g_2, \dots, g_n) (g'_1 g''_1, g'_2 g''_2, \dots, g'_n g''_n)$$

(iii)  $(e_1, e_2, \dots, e_n) \in G_1 \oplus G_2 \oplus \dots \oplus G_n$   
where  $e_i \in G_i$  be identity of  $G_i$

(iv) Inverse:  $(g_1, g_2, \dots, g_n) \in G_1 \oplus G_2 \oplus \dots \oplus G_n$ .  
Then  $(g_1^{-1}, g_2^{-1}, \dots, g_n^{-1}) \in G_1 \oplus G_2 \oplus \dots \oplus G_n$   
is inverse of  $(g_1, g_2, \dots, g_n)$ .

Note:-  $O(G_1 \oplus G_2 \oplus \dots \oplus G_n) = O(G_1) \oplus O(G_2) \oplus \dots \oplus O(G_n)$

Eg-1

Consider  $U(8) \oplus U(10)$

$$U(8) = \{1, 3, 5, 7\} \circledast_8$$

$$U(10) = \{1, 3, 7, 9\} \circledast_{10}$$

$$U(8) \oplus U(10) = \{(1,1), (1,3), (1,7), (1,9), (3,1), (3,3), (3,7), (3,9), (5,1), (5,3), (5,7), (5,9), (7,1), (7,3), (7,7), (7,9)\}$$

$$(3,7) \cdot (7,9) = (5,3)$$

$\downarrow$   
 mod 8      mod 10

$U(8) \oplus U(10)$  is a group under component-wise operations.  $(1,1)$  is identity of  $U(8) \oplus U(10)$

$$\text{order of } (1,7) \quad O(U(8) \oplus U(10)) = 16$$

Order of each element is a factor of 16 i.e. 1, 2, 4, 8, 16.

$$(1,7)^2 = (1,7)(1,7) = (1,49) = (1,9) = 2$$

$$(1,7)^3 = (1,7)(1,9) = (1,63) = (1,3) = 4$$

$$(1,7)^4 = (1,7)(1,3) = (1,21) = (1,1) = 2$$

$$\Rightarrow \text{order of } (1,7) = 4$$

Inverse of  $(1,7)$  is  $(1,3)$ .

Find inverse of  $(5,7) = ?$

$$(5,7) \cdot (5,3) = (25, 21) = (1,1)$$

$$\Rightarrow \text{inverse of } (5,7) = (5,3)$$

Ex-2

$$\mathbb{Z}_2 \oplus \mathbb{Z}_3, \quad \mathbb{Z}_2 = \{0, 1\}, \quad \mathbb{Z}_3 = \{0, 1, 2\}$$

$$\mathbb{Z}_2 \oplus \mathbb{Z}_3 = \{(0,0), (0,1), (0,2), (1,0), (1,1), (1,2)\}$$

$\mathbb{Z}_2 \oplus \mathbb{Z}_3$  is an abelian group of order '6'.

Operation is componentwise addition.

$\mathbb{Z}_2 \oplus \mathbb{Z}_3$  is a cyclic group generated by (1,1)

$$1(1,1) = (1,1)$$

$$2(1,1) = (2,2) = (0,2)$$

$$3(1,1) = (3,3) = (1,0)$$

$$4(1,1) = (4,4) = (0,1)$$

$$5(1,1) = (5,5) = (1,2)$$

$$6(1,1) = (6,6) = (0,0)$$

$\Rightarrow (1,1)$  is of order '6'  $\Rightarrow (1,1)$  is generator of  $\mathbb{Z}_2 \oplus \mathbb{Z}_3$

As we know that a finite cyclic group of order '6' is isomorphic to  $\mathbb{Z}_6$ .

$$\Rightarrow \mathbb{Z}_2 \oplus \mathbb{Z}_3 \cong \mathbb{Z}_6$$

Consider  $\mathbb{Z}_2 \oplus \mathbb{Z}_2$

To prove  $\mathbb{Z}_2 \oplus \mathbb{Z}_2 \not\cong \mathbb{Z}_4$ .

$$\mathbb{Z}_2 \oplus \mathbb{Z}_2 = \{ (0,0), (0,1), (1,0), (1,1) \}$$

$$\text{order of } (0,1) = 2$$

$$\text{order of } (1,0) = 2$$

$$\text{order of } (1,1) = 2$$

There is no element of order 4.

$\Rightarrow \mathbb{Z}_2 \oplus \mathbb{Z}_2$  is not cyclic.

Hence  $\mathbb{Z}_2 \oplus \mathbb{Z}_2 \not\cong \mathbb{Z}_4$ .

### Properties of External Direct Product:

**Theorem**  
(8.1)

The order of an element of a direct product of a finite no. of group is the least

Page No.	87
Date	

Common multiple of the orders of the components of the element i.e

$$| \langle g_1, g_2, \dots, g_n \rangle | = \text{lcm} (|g_1|, |g_2|, \dots, |g_n|)$$

Pf: let us consider the special case for  $n=2$ .

i.e T.S  $O(g_1, g_2) = \text{lcm} [O(g_1), O(g_2)]$

let  $s = \text{lcm} [O(g_1), O(g_2)]$

let  $t = O(g_1, g_2) \rightarrow O(g_1) | s \Rightarrow g_1^s = e_1$

$(g_1, g_2)^s = (g_1^s, g_2^s) = (e_1, e_2)$   $O(g_2) | s \Rightarrow g_2^s = e_2$

if  $(g_1, g_2)^s = (e_1, e_2)$ , then

$(g_1^s, g_2^s) = (e_1, e_2) \Rightarrow \text{but } O(g_1, g_2) = t$

$\Rightarrow t | s$

Also,  $(g_1^t, g_2^t) = (g_1, g_2)^t = (e_1, e_2)$

$\Rightarrow O(g_1) | t, O(g_2) | t$

$\Rightarrow t$  is a common factor of  $O(g_1)$  &  $O(g_2)$

$\Rightarrow s | t \Rightarrow s = t$

Eg-3 Determine the no. of elements of order 5 in  $\mathbb{Z}_{25} \oplus \mathbb{Z}_5$ .

Soln. If  $(a, b) \in \mathbb{Z}_{25} \oplus \mathbb{Z}_5$  has order 5, then

$O[(a, b)] = 5 = \text{lcm} [O(a), O(b)]$

Clearly, either  $O(a) = 5$  and  $O(b) = 1$  or  $5$   
or  $O(b) = 5$  and  $O(a) = 1$  or  $5$

Case-1

$$o(a) = 1, \quad o(b) = 5$$

$\Rightarrow$  there is only one choice for  $a$  i.e.  $a=0$  and 4 choices for  $b=1, 2, 3, 4$ .

$\Rightarrow$  There are four elts of order 5.

$$\Rightarrow (0, 1), (0, 2), (0, 3), (0, 4)$$

Case-2

$$o(a) = 5 \quad \& \quad o(b) = 1$$

There is only one choice for  $b=0$ , & 4 choices for 'a' i.e., 5, 10, 15, 20.

$$\boxed{(5, 0), (10, 0), (15, 0), (20, 0)}$$

Case-3.

$$o(a) = 5 \quad \& \quad o(b) = 5.$$

four choices for  $a=5, 10, 15, 20$  & four choices for  $b=1, 2, 3, 4$ .

There are 16 elts of order '5'.

$$\Rightarrow \mathbb{Z}_{25} \oplus \mathbb{Z}_5 \text{ has } \underline{24 \text{ elts of order } 5}$$

Ex. 4

Determine the no. of cyclic subgroups of order 10 in  $\mathbb{Z}_{100} \oplus \mathbb{Z}_{25}$ .

Sol<sup>n</sup>:-

Let us first find elts. in  $\mathbb{Z}_{100} \oplus \mathbb{Z}_{25}$  of order 10.

If  $(a, b) \in \mathbb{Z}_{100} \oplus \mathbb{Z}_{25}$  has order 10, then  $o[(a, b)] = 10 = \text{lcm}[o(a), o(b)]$

So, 2 cases arise —

(i)  $o(a) = 10, \quad o(b) = 1 \text{ or } 5.$

(ii)  $o(a) = 2, \quad o(b) = 5$

$$\boxed{\begin{array}{l} o(b) \text{ can't be } 10 \\ o(b) \text{ can't be } 2 \end{array}}$$

Case-I

$$o(a) = 10 \quad \& \quad o(b) = 1 \text{ or } 5.$$

Since  $\mathbb{Z}_{100}$  has a unique cyclic subgroup of order 10 & only cyclic group of order 10 has four generators.

Page No.	89
Date	

[ $\therefore$   $H = \langle a \rangle$  of order  $n$ . then  
 $H = \langle a^k \rangle$  for  $(k, n) = 1$ ]

Here  $n = 10$ .

$$k = 1, 3, 7, 9$$

If  $H$  is a cyclic subgroup of 10 then  $H = \langle a \rangle$  or  $\langle a^3 \rangle$  or  $\langle a^7 \rangle$  or  $\langle a^9 \rangle$

$\Rightarrow$  There are four choices of 'a'

Similarly, there are 5 choices for 'b'.

$\Rightarrow$  Total choices for  $(a, b) = 20$ .

Case-II

$$O(a) = 2; O(b) = 5$$

Since  $Z_{100}$  has a unique cyclic subgroup of order '2' & that subgroup has only one generator.

$\therefore$  If  $K$  is a cyclic group of order 2 then  $K = \langle a \rangle$ ,  $O(a) = 2$ .

$\Rightarrow$  There is only one choice for 'a' there are 4 choices for 'b'.

$\Rightarrow$  There are four choices for  $(a, b)$

$\Rightarrow Z_{100} \oplus Z_{25}$  has 24 elts of order 10.

Let  $K$  be a cyclic subgroup of  $Z_{100} \oplus Z_{25}$  of order 10.

$$\text{order of the subgroup } K = 10$$

No. of generators of  $K = 4$

$$= \phi(10) \quad O(x, y) = 10$$

i.e. 4 elts of order 10 generate the

same subgroup.

$\therefore$  No. of cyclic subgrp of order 10

$$= \frac{24}{4} = 6$$

Ex-4 Find the no. of elts in  $\langle 5 \rangle \oplus \langle 3 \rangle$   
as a subgroup of  $\mathbb{Z}_{30} \oplus \mathbb{Z}_{12}$ .

Sol<sup>n</sup>: Since order of 5 in  $\mathbb{Z}_{30}$  is '6',  
order of 3 in  $\mathbb{Z}_{12}$  is '4',  
 $\Rightarrow \langle 5 \rangle \oplus \langle 3 \rangle$  has a subgroup of  
order 24.

$$\begin{aligned} \therefore O(\langle 5 \rangle \oplus \langle 3 \rangle) &= O(\langle 5 \rangle) O(\langle 3 \rangle) \\ &= 6 \cdot 4 = 24 \end{aligned}$$

Thm CRITERION FOR  $h \oplus H$  TO BE CYCLIC

(8.2)

Let  $h$  &  $H$  be finite cyclic groups.  
Then  $h \oplus H$  is cyclic if & only if  
 $|h|$  &  $|H|$  are relatively prime.

Pf<sup>o</sup>:-

Let  $|h| = m$  &  $|H| = n$

$$\Rightarrow |h \oplus H| = |h| \cdot |H| = mn$$

First Part

Let  $h \oplus H$  be cyclic.

T.S  $\gcd(m, n) = 1$

Let  $\gcd(m, n) = t$ , &  $t \neq 1$ .

Since  $h$  is cyclic  $\Rightarrow \exists g \in h$  s.t.  $h = \langle g \rangle$

$$\Rightarrow |g| = m$$

$H$  is cyclic  $\Rightarrow \exists h \in H$  s.t.  $H = \langle h \rangle$

$$\Rightarrow |H| = n.$$

As  $t | m$  &  $t | n \Rightarrow m = At, n = ut$

$$\Rightarrow A = \frac{m}{t}, u = \frac{n}{t}$$

$$g^t \left( g^{\frac{m}{t}} \right)^k = g^{tk} = e$$

$$\Rightarrow m | tk \Rightarrow At | tk$$

$$\Rightarrow t | k$$

Consider  $O\left(g^{\frac{m}{t}}\right) = ?$

Page No.	91
Date	

$$\left(g^{\frac{m}{t}}\right)^t = g^{mt} = g^m = e$$

$$\Rightarrow o\left(g^{\frac{m}{t}}\right) = t \quad \& \quad o\left(h^{\frac{n}{t}}\right) = t.$$

Consider  $\left(g^{\frac{m}{t}}, e_2\right), \left(e_1, h^{\frac{n}{t}}\right) \in G \oplus H$

$$o\left(g^{\frac{m}{t}}, e_2\right) = t = o\left(e_1, h^{\frac{n}{t}}\right)$$

$\Rightarrow \langle \left(g^{\frac{m}{t}}, e_2\right) \rangle$  &  $\langle \left(e_1, h^{\frac{n}{t}}\right) \rangle$  are two distinct cyclic subgroups of  $G \oplus H$  of order 't', which is a contradiction.

[ $\therefore$  Any finite cyclic grp. has a unique subgroup of order t].

$$\Rightarrow \gcd(m, n) = 1.$$

$\Leftarrow$  Let  $K = \langle g \rangle$  &  $(m, n) = 1$ ,  $H = \langle h \rangle$   
then

$$\begin{aligned} |K \oplus H| &= \text{lcm}(|K|, |H|) \\ &= \text{lcm}(m, n) = mn \\ &= |K \oplus H| \end{aligned}$$

$$\Rightarrow K \oplus H = \langle (g, h) \rangle$$

$\Rightarrow K \oplus H$  is a cyclic group.

Corollary: An external direct product  $K_1 \oplus K_2 \oplus \dots \oplus K_n$  of a finite no. of finite cyclic group is cyclic iff  $|K_i|$  &  $|K_j|$  are relatively prime for  $i \neq j$ .

Cor.

**Criterion for  $\mathbb{Z}_{n_1} \oplus \mathbb{Z}_{n_2} \oplus \dots \oplus \mathbb{Z}_{n_k} \cong \mathbb{Z}_m$**

Let  $m = n_1 n_2 \dots n_k$  then  $\mathbb{Z}_m$  is isomorphic to  $\mathbb{Z}_{n_1} \oplus \mathbb{Z}_{n_2} \oplus \dots \oplus \mathbb{Z}_{n_k}$  iff  $n_i$  &  $n_j$  are relatively prime where  $i \neq j$ .

Sol<sup>n</sup>

$\mathbb{Z}_{n_1} \oplus \mathbb{Z}_{n_2} \oplus \dots \oplus \mathbb{Z}_{n_k}$  is cyclic iff  $n_i$  &  $n_j$  are relatively prime.

$$\therefore |\mathbb{Z}_{n_i}| = n_i$$

$$|\mathbb{Z}_{n_j}| = n_j$$

& also any 2 finite cyclic grps of same order are isomorphic therefore —

$$\mathbb{Z}_{n_1, n_2, \dots, n_k} \cong \mathbb{Z}_{n_1} \oplus \mathbb{Z}_{n_2} \oplus \dots \oplus \mathbb{Z}_{n_k}$$

$$(i) \mathbb{Z}_2 \oplus \mathbb{Z}_3 \cong \mathbb{Z}_6$$

$$(ii) \mathbb{Z}_2 \oplus \mathbb{Z}_3 \oplus \mathbb{Z}_5 \cong \mathbb{Z}_{30} \cong \mathbb{Z}_2 \oplus \mathbb{Z}_{15} \cong \mathbb{Z}_6 \oplus \mathbb{Z}_5$$

$$(iii) \mathbb{Z}_2 \oplus \mathbb{Z}_2 \oplus \mathbb{Z}_3 \oplus \mathbb{Z}_5 \cong \mathbb{Z}_2 \oplus \mathbb{Z}_6 \oplus \mathbb{Z}_5$$

$$\cong \mathbb{Z}_6 \oplus \mathbb{Z}_{10}$$

$$\cong \mathbb{Z}_2 \oplus \mathbb{Z}_3 \oplus \mathbb{Z}_2 \oplus \mathbb{Z}_5$$

$$(iv) \text{ But } \mathbb{Z}_2 \oplus \mathbb{Z}_{30} \not\cong \mathbb{Z}_{60}$$

$U(n)$  as an EDP

Theorem let  $\gcd(s, t) = 1$ . then

$$U(st) \cong U(s) \oplus U(t)$$

(154)

no. of elems in  $U(n) = \phi(n)$

$\phi(n) =$  No. of +ve integers less than  $n$  & co-prime to  $n$ .

Eg.

$$|U(8)| = \phi(8) = 4 \quad \left\{ \begin{array}{l} \because 1, 3, 5, 7 \text{ are integers} \\ \text{less than } 8 \text{ and relatively} \\ \text{co-prime to } 8 \end{array} \right.$$

$$\text{So } |U(st)| = \phi(st)$$

$$|U(s) \oplus U(t)| = |U(s)| |U(t)|$$

$$= \phi(s) \cdot \phi(t)$$

Since  $\gcd(s, t) = 1$

$$\Rightarrow \phi(st) = \phi(s) \phi(t)$$

$$\Rightarrow |U(st)| = |U(s) \oplus U(t)|$$

$\therefore$  we can define a map bet<sup>m</sup>  $U(st)$  &  $U(s) \oplus U(t)$  which is 1-1 will be onto.

Define  $f: U(st) \rightarrow U(s) \oplus U(t)$  as  
 $f(x) = (x \bmod s, x \bmod t)$

well defined

let  $x = y$

$$\Rightarrow x \bmod s = y \bmod s$$

$$\& x \bmod t = y \bmod t$$

$$\Rightarrow (x \bmod s, x \bmod t)$$

$$= (y \bmod s, y \bmod t)$$

$$\Rightarrow f(x) = f(y)$$

1-1 let  $f(x) = f(y)$

$$\Rightarrow (x \bmod s, x \bmod t) = (y \bmod s, y \bmod t)$$

$$\Rightarrow x \bmod s = y \bmod s$$

$$\& x \bmod t = y \bmod t$$

$$\therefore \gcd(s, t) = 1 \Rightarrow x \bmod st = y \bmod st$$

$$\Rightarrow st \mid x - y$$

$$\Rightarrow x - y = kst \text{ for some } k \in \mathbb{Z}$$

$$\Rightarrow st \mid x - y \Rightarrow x - y = 0$$

$$\Rightarrow x = y \quad f \text{ is 1-1.}$$

H.M  $f(xy) = (xy \bmod s, xy \bmod t)$

$$f(x)f(y) = (x \bmod s, x \bmod t) (y \bmod s, y \bmod t)$$

$$= ((x \bmod s)(y \bmod s) \bmod s, (x \bmod t)$$

$$(y \bmod t) \bmod t)$$

$$= (xy \bmod s, xy \bmod t)$$

$$[\because (a \bmod n)(b \bmod n) \bmod n = ab \bmod n]$$

$\Rightarrow f$  is an isomorphism

$$\Rightarrow U(st) \cong U(s) \oplus U(t)$$

Page No.	94
Date	

Eg.:

$$U(105) \cong U(7) \oplus U(15) \quad (7, 15) = 1$$

$$U(105) \cong U(21) \oplus U(5) \quad (21, 5) = 1$$

$$U(105) \cong U(3) \oplus U(7) \oplus U(5)$$

\*

Considers  $U_k(m) = \{x \in U(m) \mid x \equiv 1 \pmod{k}\}$

where  $k$  is a divisor of  $m$ .

$U_k(m)$  is a subgroup of  $U(m)$ .

Theorem

Let  $\gcd(s, t) = 1$ , Then

8.3  
(p-184)

$$U_s(st) \cong U(st) \quad \& \quad U_t(st) \cong U(st)$$

Pf.:

Define  $f: U_s(st) \rightarrow U(st)$

$$f(x) = x \pmod{t}$$

$g: U_t(st) \rightarrow U(st)$  as  $g(x) = x \pmod{s}$ .

PT

$f$  &  $g$  are isomorphic

Corollary

Let  $m = n_1 n_2 \dots n_k$  where  $\gcd(n_i, n_j) = 1$  for  $i \neq j$ .

Then

$$U(m) \cong U(n_1) \oplus U(n_2) \oplus U(n_3) \oplus \dots \oplus U(n_k)$$

Note:

(i)  $U(2) \cong \{0\}$

(ii)  $U(4) \cong \mathbb{Z}_2$

(iii)  $U(2^n) \cong \mathbb{Z}_2 \oplus \mathbb{Z}_{2^{n-2}} \quad \forall n \geq 3$

(iv)  $U(p^n) \cong \mathbb{Z}_{p^{n-1}} \oplus \mathbb{Z}_{p^{n-1}}$  for odd prime  $p$ .

Eg

Show  $U(105) \cong \mathbb{Z}_2 \oplus \mathbb{Z}_4 \oplus \mathbb{Z}_6$ .

$$U(105) = U(3 \cdot 7 \cdot 5)$$

$$\cong U(3) \oplus U(5) \oplus U(7)$$

$$\cong \mathbb{Z}_2 \oplus \mathbb{Z}_4 \oplus \mathbb{Z}_6 \quad (\text{By Above})$$

$$U(720) = U(5 \cdot 9 \cdot 16)$$

$$\cong U(5) \oplus U(3^2) \oplus U(2^4)$$

$$\cong \mathbb{Z}_4 \oplus \mathbb{Z}_6 \oplus \mathbb{Z}_2 \oplus \mathbb{Z}_4$$

$$\cong \mathbb{Z}_2 \oplus \mathbb{Z}_4 \oplus \mathbb{Z}_6 \oplus \mathbb{Z}_4$$

(iii) PT - There are 96 Automorphism of  $\mathbb{Z}_{720}$  of order 12.

pf:  
=

Since  $U(n) \cong \text{Aut}(\mathbb{Z}_n)$

$\therefore U(720) \cong \text{Aut}(\mathbb{Z}_{720})$

$\therefore$  It is sufficient to show that there are 96 elts of  $U(720)$  of order 12.

Now

$$U(720) \cong \mathbb{Z}_2 \oplus \mathbb{Z}_4 \oplus \mathbb{Z}_6 \oplus \mathbb{Z}_4$$

It is sufficient to find elts of order 12 in  $\mathbb{Z}_2 \oplus \mathbb{Z}_4 \oplus \mathbb{Z}_6 \oplus \mathbb{Z}_4$

Let  $(a, b, c, d) \in \mathbb{Z}_2 \oplus \mathbb{Z}_4 \oplus \mathbb{Z}_6 \oplus \mathbb{Z}_4$  be of order 12.

$$\text{i.e. } |(a, b, c, d)| = 12.$$

$$\text{Now, } |(a, b, c, d)| = \text{lcm}(|a|, |b|, |c|, |d|)$$

$$\text{Since, } a \in \mathbb{Z}_2 \quad \therefore a=0, \text{ or } a=1$$

$$\therefore |a| = 1 \text{ or } 2$$

$$\Rightarrow \text{lcm}(|a|, |b|, |c|, |d|) = \text{lcm}(|b|, |c|, |d|)$$

Case I

$$o(b) = 4, o(c) = 3 \text{ or } 6, o(d) = 2 \text{ or } 4$$

<sup>b</sup> Arbitrary

There are 2 choices for b

$$\begin{array}{ccc} 4 & \text{---} & c \\ 4 & \text{---} & d \end{array}$$

$$\therefore \text{Total choices} = 2 \cdot 4 \cdot 4 = 32$$

Case II,

$$o(b) = 1 \text{ or } 2, o(c) = 3 \text{ or } 6, o(d) = 4$$

There are 2 choices for b.

$$\begin{array}{ccc} 4 & \text{---} & c \\ 2 & \text{---} & d \end{array}$$

$$\Rightarrow \text{Total choices} = 2 \cdot 4 \cdot 2 = 16$$

Page No.	96
Date	

Hence  $\text{lcm}(|b|, |c|, |d|) = 12$  in  $32+16 = 48$  ways

Since  $\phi(12) = 1$  or  $2$ .

$\text{lcm}(|b|, |c|, |d|) = 12$  in  $48 \times 2 = 96$  ways  
 $\Rightarrow$  There are 96 ~~ways~~ Automorphisms of  $\mathbb{Z}_{120}$  of order 12.

Chapter - End

\* \* \*

## CHAPTER - 9

(only, Internal Direct Product) (9-181)

Let  $H \& K$  be normal subgroups of a group  $G$ . Then  $G$  is the Internal Direct Product of  $H \& K$  &  $G = H \times K$  if

(i)  $G = HK$   $\leftarrow$

(ii)  $H \cap K = \{e\}$

Note:- For Internal Direct Product :-  $H \& K$  must be subgroups of the same group. For External Direct Product :-  $H \& K$  can be any groups.

Ex:- Let  $G = S_3$   
 $= \{I, (12), (23), (13), (123), (132)\}$

Let  $H = \langle (123) \rangle = \{I, (123), (132)\}$

$K = \langle (12) \rangle = \{I, (12)\}$

$G$  is internal direct product of  $H \& K$

where  $G \cong H \oplus K$

Now  $HK = \langle (123) \rangle \langle (12) \rangle$   
 $= \{I, (12), (123), (123)(12), (132), (132)(12)\}$

Page No.	97
Date	

$$HK = \{ I, (12), (13), (23), (123), (132) \}$$

Now here  $G = HK$  &  $H \cap K = \{e\}$

But  $G \not\cong H \oplus K$

$\therefore H \oplus K$  is cyclic &  $S_3$  is not

$$H \oplus K = \{ (I, I), (123), (12), (123), I, (I, (12)), (132), I, (132), (12) \}$$

$$|H \oplus K| = 6$$

$$|(132), (12)| = 6$$

$H \oplus K$  is cyclic, But  $S_3$  is not

$\therefore$  there is no elt. of order 6 in  $S_3$

$\Rightarrow G$  is not an IDP.

(as  $K$  is not normal)

Def: Internal Direct Product of  $H_1 \times H_2 \times \dots \times H_n$

Let  $H_1, H_2, \dots, H_n$  be finite collection of normal subgrp of  $G$ . Then  $G$  is the IDP of  $H_1, H_2, \dots, H_n$  if

(i)  $G = H_1 H_2 \dots H_n$

(ii)  $(H_1 H_2 \dots H_i) \cap H_{i+1} = \{e\} \quad \forall i = 1, 2, 3, \dots, n-1$

or if  $G$  is an IDP of  $H_1, H_2, \dots, H_n$  then

$$H_i \cap H_j = \{e\} \quad \forall i \neq j$$

Lemma 1: — let  $G$  be the IDP of  $H$  &  $K$ , then elements of  $H$  &  $K$  commute (i.e.  $hk = kh$ )

$$\forall h \in H, k \in K$$

Pf:  $G$  is IDP of  $H$  &  $K$   
 $\Rightarrow H \trianglelefteq G$  &  $K \trianglelefteq G$  &  $G = HK$  &  $H \cap K = \{e\}$

TP:  $hk = kh \quad \forall h \in H$  &  $k \in K$ .

Consider,  $hk h^{-1} k^{-1} = h (k h^{-1} k^{-1}) \in hH = H$

$$\because kh^{-1}k^{-1} \in kHk^{-1} \quad \forall k \in K \Rightarrow k \in \Omega$$

and as  $H \trianglelefteq \Omega$ .

$$\Rightarrow kHk^{-1} \subseteq H \Rightarrow kh^{-1}k^{-1} \in H$$

$$\text{Hence, } hkh^{-1}k^{-1} = (hkh^{-1})k^{-1} \in Kk^{-1} \\ = K(K\Omega) = \Omega$$

$$\Rightarrow hkh^{-1}k^{-1} \in H \cap K = \{e\}$$

$$\Rightarrow hkh^{-1}k^{-1} = e$$

$$\Rightarrow hk = kh \quad \forall h \in H, k \in K$$

Result:

So, if  $\Omega$  is IDP of  $H_1, H_2, \dots, H_n$ , then

$$h_i h_j = h_j h_i \quad \forall h_i \in H_i, h_j \in H_j, i \neq j$$

Lemma-2. If  $\Omega$  is the IDP of  $H_1, H_2, \dots, H_n$ . Then each member of  $\Omega$  can be expressed uniquely as  $h_1 h_2 \dots h_n$  where  $h_i \in H_i$ .

pf:

$\Omega$  is IDP of  $H_1, H_2, \dots, H_n$

$$\Rightarrow \Omega = H_1 \times H_2 \times \dots \times H_n \quad \text{iff } \text{---}$$

$$(i) \quad \Omega = H_1 H_2 \dots H_n \quad \& \quad H_i \cap H_j = \{e\}, \quad i \neq j$$

$$\text{or } [(H_1 H_2 \dots H_i) \cap H_{i+1}] = \{e\}, \quad i = 1, 2, 3, \dots, n-1.$$

Let

$$x \in \Omega$$

$$\therefore x \in H_1 H_2 \dots H_n$$

$$\Rightarrow x = h_1 h_2 \dots h_n \quad \text{for some } h_i \in H_i$$

Uniqueness:

$$\text{Let } x = h_1 h_2 \dots h_n, \quad h_i, h'_i \in H_i$$

$$\& \quad x = h'_1 h'_2 \dots h'_n$$

$$\Rightarrow h_1 h_2 \dots h_n = h'_1 h'_2 \dots h'_n$$

$$(h_1 h_2 \dots h_{n-1}) h_n (h_n^{-1}) = (h'_1 h'_2 \dots h'_{n-1})$$

$$\Rightarrow h_n (h_n^{-1}) = (h_1 h_2 \dots h_{n-1})^{-1} (h'_1 h'_2 \dots h'_{n-1})$$

$$= (h_1^{-1} h_1') (h_2^{-1} h_2') \dots (h_{m-1}^{-1} h_{m-1}')$$

$$\Rightarrow (h_m (h_m')^{-1}) \in H_1 H_2 \dots H_{m-1}$$

$$\Rightarrow h_m (h_m')^{-1} \in H_m \cap (H_1 H_2 \dots H_{m-1}) = \{e\}$$

$$\Rightarrow h_m (h_m')^{-1} = e$$

$$\Rightarrow h_m = h_m'$$

$$\Rightarrow h_1 h_2 \dots h_{m-1} = h_1' h_2' \dots h_{m-1}'$$

$$h_1 = h_1', h_2 = h_2', \dots, h_m = h_m'$$

Imply

Theorem  
(9.6)

$H_1 \times H_2 \times \dots \times H_m \cong H_1 \oplus H_2 \oplus \dots \oplus H_m$ . If a group  $G$  is the IDP of a finite no. of subgroups  $H_1, H_2, \dots, H_m$  then  $G$  is isomorphic to the external direct product of  $H_1, H_2, \dots, H_m$ .

2014

Pf:  $G \cong H_1 \oplus H_2 \oplus \dots \oplus H_m$  — (1)

As  $G$  is the IDP of  $H_1, H_2, \dots, H_m$

$$\Rightarrow H_i \triangleleft G \quad \forall i$$

$$\& G = H_1 H_2 \dots H_m \& (H_1 H_2 \dots H_i) \cap H_{i+1} = \{e\} \\ \& i = 1, 2, 3, \dots, m-1$$

T.P

Define a map  $\phi: G \rightarrow H_1 \oplus H_2 \oplus \dots \oplus H_m$

$$\text{as } \phi(h_1 h_2 \dots h_m) = (h_1, h_2, \dots, h_m)$$

T.P

$\phi$  is well define, 1-1, HM & onto.

well-define & 1-1

$$\text{let } h_1 h_2 \dots h_m = h_1' h_2' \dots h_m'$$

$$\Rightarrow h_i = h_i' \quad \forall i \quad (\text{By lemma})$$

$$\Rightarrow (h_1, h_2, \dots, h_m) = (h_1', h_2', h_3', \dots, h_m')$$

$$\Rightarrow \phi(h_1 h_2 \dots h_m) = \phi(h_1' h_2' \dots h_m')$$

H.M

$$\phi((h_1 h_2 \dots h_m)(h_1' h_2' \dots h_m'))$$

$$= \phi(h_1 h_1' h_2 h_2' \dots h_m h_m') \quad [\text{By 1 lemma}]$$

Page No.	100
Date	

$$\begin{aligned}
 &= (h_1 h_1', h_2 h_2', \dots, h_n h_n') \\
 &= (h_1, h_2, \dots, h_n) (h_1', h_2', \dots, h_n') \\
 &= \phi(h_1, h_2, \dots, h_n) \phi(h_1', h_2', \dots, h_n')
 \end{aligned}$$

onto let  $(\gamma_1, \gamma_2, \dots, \gamma_n) \in H_1 \oplus H_2 \oplus \dots \oplus H_n$   
 $\Rightarrow \gamma_i \in H_i$

$\Rightarrow \gamma_1, \gamma_2, \dots, \gamma_n \in H_1, H_2, \dots, H_n$

s.t  $\phi(\gamma_1, \gamma_2, \dots, \gamma_n) = (\gamma_1, \gamma_2, \dots, \gamma_n)$

$\Rightarrow G \cong H_1 \oplus H_2 \oplus \dots \oplus H_n$

Result: If  $G = H_1 \oplus H_2 \oplus \dots \oplus H_n$  then  $G$  can be expressed as the IDP of subgroups isomorphic to  $H_1, H_2, \dots, H_n$ .

eg If  $G = H_1 \oplus H_2$   
 then  $G = \overline{H_1} \times \overline{H_2}$  where  $\overline{H_1} = H_1 \oplus \{e\}$   
 $\overline{H_2} = \{e\} \oplus H_2$   
 $H_1 \cong \overline{H_1}$  &  $H_2 \cong \overline{H_2}$

Eg. Express  $U(105)$  as IDP of 2 subgroups.

$$U(105) = U(15, 7) \cong U(15) \oplus U(7)$$

$$[\because U(st) \cong U(s) \oplus U(t), \text{ if } (s, t) = 1]$$

$$\text{Also, } U_8(st) \cong U(st)$$

$$\text{So } U_7(105) \cong U(15)$$

$$\& U_{15}(105) \cong U(7)$$

$$\Rightarrow U(105) \cong U_7(105) \oplus U_{15}(105)$$

$$\cong U_7(105) \times U_{15}(105)$$

$\therefore H_1 \oplus H_2 \cong H_1 \times H_2$  if  $H_1$  &  $H_2$  are

subgroups of  $G$  if  $k|n \Rightarrow U_k(n) < U(n)$

$$\text{Also, } U(105) = U(5, 21) = U_5(105) \times U_{21}(105)$$

$$\cong U(21) \oplus U(5)$$

Page No.	107
Date	

Q.  $U(21) \oplus U(5)$ .

Eg. Express  $U(105)$  as IDP of 3 subgrps.

$$\begin{aligned} U(105) &= U(3 \cdot 5 \cdot 7) \\ &= U_{35}(105) \times U_{21}(105) \times U_{15}(105) \\ &= \{1, 7, 11\} \times \{1, 22, 43, 64\} \times \\ &\quad \{1, 16, 31, 16, 61, 76\} \\ &\approx U(3) \oplus U(5) \oplus U(7) \end{aligned}$$

[ P. Kalika Notes, available at <https://pkalika.wordpress.com/> ]

(1) Show that  $G \oplus H$  is abelian iff  $G$  &  $H$  are abelian.

Sol<sup>n</sup>: Let  $G \oplus H$  be abelian.

Let  $(g_1, h_1)$  &  $(g_2, h_2) \in G \oplus H$  where  
 $g_1, g_2 \in G, h_1, h_2 \in H$

$$\text{Now, } (g_1, h_1)(g_2, h_2) = (g_2, h_2)(g_1, h_1)$$

$$\Rightarrow (g_1 g_2, h_1 h_2) = (g_2 g_1, h_2 h_1)$$

$$\Rightarrow \begin{aligned} g_1 g_2 &= g_2 g_1 \\ h_1 h_2 &= h_2 h_1 \end{aligned} \quad \therefore G \text{ \& } H \text{ are Abelian.}$$

( $\Rightarrow$ ) Let  $G$  &  $H$  be Abelian.

$$\begin{aligned} \text{Consider } (g_1, h_1)(g_2, h_2) &= (g_1 g_2, h_1 h_2) \\ &\quad \forall (g_1, h_1), (g_2, h_2) \in G \oplus H \\ &= (g_2 g_1, h_2 h_1) \\ &= (g_2, h_2)(g_1, h_1) \end{aligned}$$

(5) Prove or disprove that  $\mathbb{Z} \oplus \mathbb{Z}$  is a cyclic group.

Let if possible  $\mathbb{Z} \oplus \mathbb{Z}$  is cyclic.

$$\Rightarrow \exists (a, b) \in \mathbb{Z} \oplus \mathbb{Z} \text{ s.t. } \mathbb{Z} \oplus \mathbb{Z} = \langle (a, b) \rangle$$

(i) if  $a = b$ .

$$\mathbb{Z} \oplus \mathbb{Z} = \langle (a, a) \rangle$$

Then  $(m, n) \in \mathbb{Z} \oplus \mathbb{Z}$  can't be written as integral multiple of  $(a, a)$  in ~~many~~ way.

(ii) If  $a \neq b$ .

Then all elts of the form  $(m, m)$  don't belong to  $\mathbb{Z} \oplus \mathbb{Z}$ ,  $\therefore (m, m)$  can't be written as integral multiple of  $(a, b)$ .

$\Rightarrow \mathbb{Z} \oplus \mathbb{Z}$  is not cyclic.

Q.6 Show that  $\mathbb{Z}_3 \oplus \mathbb{Z}_2 \not\cong \mathbb{Z}_4 \oplus \mathbb{Z}_4$ .

$$|\mathbb{Z}_3 \oplus \mathbb{Z}_2| = 16 = |\mathbb{Z}_4 \oplus \mathbb{Z}_4|$$

Pf:- order of elts of  $\mathbb{Z}_3 \oplus \mathbb{Z}_2$  are 1, 2, 4, 8  
 $\mathbb{Z}_4 \oplus \mathbb{Z}_4$  are 1, 2, 4

There is no elt. of order 8 in  $\mathbb{Z}_4 \oplus \mathbb{Z}_4$

$\therefore \mathbb{Z}_3 \oplus \mathbb{Z}_2 \not\cong \mathbb{Z}_4 \oplus \mathbb{Z}_4$

Q.7 What is the order of any non-identity elt. of  $\mathbb{Z}_3 \oplus \mathbb{Z}_3 \oplus \mathbb{Z}_3$ ??

Pf:- let  $(a, b, c)$  be any non-id elt. of  $\mathbb{Z}_3 \oplus \mathbb{Z}_3 \oplus \mathbb{Z}_3$ .

$$O(a, b, c) = \text{lcm}[|a|, |b|, |c|]$$

But  $a, b, c \in \mathbb{Z}_3$ , the only possible order are 1 & 3.

as  $(a, b, c) \neq (0, 0, 0)$

$\therefore$  at least one of  $|a|, |b|, |c| \neq 1$ .

$$\Rightarrow O(a, b, c) = \text{lcm}[|a|, |b|, |c|] = 3.$$

Q.8 How many subgroups of order 4 does  $\mathbb{Z}_4 \oplus \mathbb{Z}_2$  have?

$$\mathbb{Z}_4 \oplus \mathbb{Z}_2 = \{ (0,0), (1,0), (2,0), (3,0), (0,1), (1,1), (2,1), (3,1) \}$$

$\langle (a, b) \rangle$  is a subgroup of  $\mathbb{Z}_4 \oplus \mathbb{Z}_2$  if

$$|(a, b)| = 4$$

Page No.	103
Date	

elts of order 4 in  $\mathbb{Z}_4 \oplus \mathbb{Z}_2$  are  
 $(1,1), (1,0), (3,0), (3,1)$

[Result: -  
 $|a|^n = n$   
 $\langle a \rangle = \langle a^k \rangle$  iff  $(k,n) = 1$ ]

Let  $H$  be a ~~group~~ subgroup of  $\mathbb{Z}_4 \oplus \mathbb{Z}_2$  of order 4.

$$H = \langle (1,1) \rangle$$

then,  $H = \langle (1,1)^3 \rangle = \langle (3,3) \rangle = \langle (3,1) \rangle$

$\therefore$  subgroups of order 4 generated by  $(1,1)$  &  $(3,1)$  are same -

$$\langle (1,1) \rangle = \langle (3,1) \rangle$$

Now, the subgroup  $K = \langle (1,0) \rangle$ ,  $|K| = 4$   
 $= \langle (1,0)^3 \rangle$   
 $= \langle (3,0) \rangle$

$\Rightarrow$  No. of distinct cyclic grps of order 4 are,

$$H = \langle (1,1) \rangle$$

$$K = \langle (1,0) \rangle$$

Also,  $L = \{(0,0), (0,1), (2,0), (2,1)\}$  is a non-cyclic grp of order 4.

$\therefore \mathbb{Z}_4 \oplus \mathbb{Z}_2$  has 3 subgrp. of order 4.

23

find all subgroups of order 3 in  $\mathbb{Z}_9 \oplus \mathbb{Z}_3$

Groups of prime order are cyclic

Now, subgroup of order 3 must be cyclic.  
 So, we have to find cyclic grps. of order 3 in  $\mathbb{Z}_9 \oplus \mathbb{Z}_3$

Let  $(a,b) \in \mathbb{Z}_9 \oplus \mathbb{Z}_3$  &  $|(a,b)| = 3$

$$|(a,b)| = \text{lcm}(|a|, |b|)$$

$$|a| = 1 \text{ or } 3$$

$$|a| = 1$$

$$|b| = 3$$

$$|b| = 1 \text{ or } 3$$

$$|a| = 3$$

$$|b| = 1$$

$$|a| = 3$$

$$|b| = 3$$

Page No.	104
Date	

elts. of order 3 in  $\mathbb{Z}_9 \oplus \mathbb{Z}_3$  are  
 $(0,1), (0,2), (0,0), (3,1), (3,2), (6,0), (6,1), (6,2)$ .

$$\text{Now } H_1 = \langle (0,1) \rangle = \langle (0,1)^2 \rangle = \langle (0,2) \rangle$$

$$[ \langle a \rangle = \langle a^k \rangle \text{ iff } (k,n) = 1 ]$$

$$|a| = n$$

$$H_2 = \langle (3,0) \rangle = \langle (3,0)^2 \rangle = \langle (6,0) \rangle$$

$$H_3 = \langle (3,1) \rangle = \langle (3,1)^2 \rangle = \langle (6,2) \rangle$$

$$H_4 = \langle (3,2) \rangle = \langle (3,2)^2 \rangle = \langle (6,4) \rangle = \langle (6,1) \rangle$$

$\therefore$  No. of distinct subgroups of order 3 are  $\langle (0,1) \rangle, \langle (3,0) \rangle, \langle (3,1) \rangle, \langle (3,2) \rangle$

Q.33 Prove that  $D_3 \oplus D_4 \not\cong D_{24}$

Pf:- Every Rotation in  $D_{24}$  has order 24.

Now, we'll prove that  $D_3 \oplus D_4$  has no elt. of order 24.

Any Rotation in  $D_3$  has order 3 & reflection about line of symmetry has order 2.

$\therefore$  Max. order of any elt. of  $D_3 = 3$ .

lily,  $D_4 = 4$

$\therefore$  Max. order of any elt. of  $D_3 \oplus D_4 = \text{lcm}(3,4) = 12$

$\therefore$  There is no. elt. of order 24 in  $D_3 \oplus D_4 \Rightarrow D_{24} \not\cong D_3 \oplus D_4$ .

Q.36 Suppose  $G$  is a group of order 4. and  $x^2 = e$  for  $x \in G$ . Prove that  $G$  is isomorphic to  $\mathbb{Z}_2 \oplus \mathbb{Z}_2$ .

Pf:  
=

$$x \in G, \quad \& \quad x^2 = e \quad \forall x \in G.$$

$$\Rightarrow x = x^{-1}$$

If every elt. is its own inverse then  $G$  is abelian.

Now,  $G$  is a <sup>finite</sup> abelian grp. of order 4.

$$\Rightarrow G \cong \mathbb{Z}_4 \text{ or } G \cong \mathbb{Z}_2 \oplus \mathbb{Z}_2.$$

Now,  $\mathbb{Z}_4$  has an elt. of order 4.  
But  $G$  has no elt. of order 4.

$$\Rightarrow G \not\cong \mathbb{Z}_4.$$

$$\therefore G \cong \mathbb{Z}_2 \oplus \mathbb{Z}_2.$$

Q. 40  
Ans

Express  $U(165)$  as an EDP of cyclic additive groups of the form  $\mathbb{Z}_n$

$$U(165) = U(3 \cdot 5 \cdot 11) \quad U(st) \cong U(s) \oplus U(t)$$

$$\Leftrightarrow \phi(st) = 1$$

$$\Rightarrow U(165) \cong U(3) \oplus U(5) \oplus U(11)$$

$$\text{Also, } U(p^n) \cong \mathbb{Z}_{p^n - p^{n-1}}$$

$$U(165) = \mathbb{Z}_{3^1 - 3^0} \oplus \mathbb{Z}_{5^1 - 5^0} \oplus \mathbb{Z}_{11^1 - 11^0}$$

$$= \mathbb{Z}_2 \oplus \mathbb{Z}_4 \oplus \mathbb{Z}_{10}$$

Q. 41

Express  $U(165)$  as an EDP of  $U$ -groups.

$$U(165) = U(3 \cdot 5 \cdot 11) = U(3) \oplus U(5) \oplus U(11)$$

$$= U(15) \oplus U(11)$$

$$= U(33) \oplus U(5)$$
